

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. STATISTICS
OF
RAILWAYS IN THE UNITED STATES.

INTERSTATE COMMERCE COMMISSION,
DIVISION OF STATISTICS,
Washington, D. C., June 30, 1901.

To the Honorable Members of the Interstate Commerce Commission.

SIRS: I have the honor to submit this the Thirteenth Annual Report on the Statistics of Railways in the United States, being the report for the year ending June 30, 1900.

The exhibits in this report are in the main the same as those of previous reports. In two instances only does the report present novel features: First, taxes paid by railways are compiled by States, and the amount paid per mile of line within each State, as well as the aggregate amount, is shown; second, computations which rest on the basis of train mileage follow the new rules adopted relative to mixed train mileage. In all other respects this report conforms in its contents and methods of computation to previous reports.

The year covered by this report is the first since the publication by the Census Office of the population of the United States in 1900, and it has been found necessary on this account to modify slightly the assignment of railway mileage to the number of inhabitants. Reference to this feature will be made in its proper place.

In 1890 the Census Office prepared and published a compilation of railway statistics for the ten years subsequent to 1880, and it might be appropriate in this report, which closes a decade since 1890, to lay special stress upon the changes which railway statistics exhibit during the past ten years. In view, however, of the fact that the Interstate Commerce Commission designs shortly to publish a Ten-Year Book on American Railways, including statistical data relative to the condition and operation of railways since 1890, it seems best to confine this report to the customary statements.

The titles of the tables contained in the body of this report are:

Table I. Classification of Railways and Mileage for the Year ending June 30, 1900.

Table II. Amount of Railway Capital at the Close of the Year ending June 30, 1900.

Table III. Earnings and Income for the Year ending June 30, 1900:

A. Earnings from Operation.

B. Income from Property Owned but not Operated.

Table IV. General Expenditures for the Year ending June 30, 1900:

A. Operating Expenses.

B. Fixed Charges and Summary of Expenditures.

Table V. Charges against Income on account of Railway Capital during the Year ending June 30, 1900.

Table VI. General Balance Sheet for the Year ending June 30, 1900.

In the text of this report will be found summaries presenting significant data upon—

Mileage of Railways, Classified by States and Territories and by Groups.

Classification of Railways according to Organization for Operation.

Equipment of Railways, showing the Number of Locomotives and Cars by Classes.

Men Employed on Railways, Classified according to Occupation. This statement shows also the average daily and total yearly compensation of each class of employees.

Capitalization and Valuation of Railway Property, Classified according to its Character and also according to the Rate of Interest and Dividends Paid.

Freight Traffic Movement.

Public Service of Railways, from which may be learned the Quantity and Density of both Passenger and Freight Traffic.

Earnings and Expenses, being an Analysis of the Income Account of Railways.

General Balance Sheet.

Taxes.

Railway Accidents.

RECEIVERSHIPS.

Appended to this report will be found a statement showing the railways in the hands of receivers on June 30, 1900. By referring to this statement and placing it in comparison with the corresponding statement of the previous year, the following facts may be observed:

The number of railways in the hands of receivers on June 30, 1900, was 52. The number removed from the management of receiverships during the year was 35, and the number placed under the charge of

receivers was 16, showing a net decrease of 19 as compared with the corresponding date of the previous year.

The operated mileage of roads under receivers on June 30, 1900, was 4,177.91 miles, of which 3,640.32 miles was owned mileage.

A comparison with the corresponding figures for the previous year shows a net decrease in the operated mileage of this class of roads of 5,675.22 miles, and in the owned mileage of 3,585.30 miles. Of the roads in the hands of receivers on June 30, 1900, 5 had an operated mileage in excess of 300 miles, 7 an operated mileage between 100 and 300 miles, and 30 an operated mileage of less than 100 miles. Six of the roads named were not in operation, and 4 were leased for operation. The capital stock represented by railways in the hands of receivers on June 30, 1900, compiled from the most available data at hand, was \$108,096,855, the funded debt was \$107,393,022, and current liabilities were \$35,531,620. These figures show a decrease of \$112,113,833 in the amount of capital stock represented by roads in the hands of receivers and a decrease of \$199,093,718 in the amount of funded debt so represented.

The following is a statement of the roads operating a mileage in excess of 100 miles which were taken out of the hands of receivers during the year covered by this report:

Name of road.	Operated mileage.
Baltimore and Ohio Railroad.....	2,024
Baltimore and Ohio Southwestern Railway.....	922
West Virginia and Pittsburgh Railroad	159
Cleveland, Canton and Southern Railroad.....	212
Cincinnati, New Orleans and Texas Pacific Railway.....	338
Chicago, Peoria and St. Louis Railroad, of Illinois.....	282
St. Louis, Chicago and St. Paul Railway, of Illinois.....	111
Wisconsin Central Company	422
Wisconsin Central Railroad	582
Sioux City, O'Neill and Western Railway.....	129
Kansas City, Pittsburg and Gulf Railroad.....	840
Kansas Midland Railway.....	106

Among the roads placed under the management of receivers the following are the more important:

Name of road.	Operated mileage.
Chicago and Grand Trunk Railway.....	335
Omaha and St. Louis Railroad	144
Omaha, Kansas City and Eastern Railroad	171
Vicksburg, Shreveport and Pacific Railroad	171

MILEAGE.

1. Railway Mileage, by States and Territories.
2. Railway Mileage, by Groups.
3. Railway Mileage, by Groups, showing Length of all Tracks.

The first summary in this group shows the distribution of railway mileage by States, and the increase or decrease in railway mileage during the year ending June 30, 1900. The length of line per 100 square miles of territory and per 10,000 inhabitants is also presented.

¹ See note 2.² Excludes 21.80 miles in Alaska.³ On basis of 2,970,038 square miles, which covers "land surface" only, and excludes Alaska.⁴ On basis of 75,994,575 population of the United States in 1900, excluding Alaska and persons in the military and naval service stationed abroad.⁵ Average for 1890 based on population of 62,947,714—the increase in population during the following decade being apportioned on the basis of an annual increase of 1,304,686.

The aggregate length of line in the United States on June 30, 1900, was 193,345.78 miles, being an increase of 4,051.12 miles as compared with the report for the previous year. By referring to the totals at the bottom of the table it will be observed that this increase in mileage is greater than for any other year subsequent to 1893, and indicates that the return of prosperity is reflected in railway construction as well as in increased railway traffic.

The number of miles of line per 100 square miles of territory on June 30, 1900, was 6.51. The corresponding figure in 1890 was 5.51, showing an increase of exactly 1 mile per 100 square miles of territory during the past ten years.

The number of miles of line per 10,000 inhabitants on June 30, 1900, was 25.44. The corresponding figure for the year 1890 was 25.99. The figures for these two dates are correct so far as the number of

inhabitants of the United States is concerned, and do not, like corresponding figures for intermediate years, rest upon an assumption relative to the increase in population. They show that population and mileage have increased at practically the same rate, the difference in mileage being 0.55 of a mile for each 10,000 inhabitants. To state this in figures, the railway mileage in the United States in 1890 was 163,597.05 miles, and in 1900 was 193,345.78 miles. The population of the United States in 1890 was 62,947,714, and in 1900 was 75,994,575, the population of Alaska and persons in the military and naval service stationed abroad being excluded. Should the assignment of railway mileage to inhabitants for the intermediate years between 1890 and 1900, given in the above table, be compared with corresponding statements in previous reports, a discrepancy will be observed. This is due to the fact that in previous reports it was assumed that the annual increase in population was 1,250,000, while the fact, as shown by the Twelfth Census, is that the annual increase amounted to 1,304,686. The assignment of mileage to population has been modified accordingly.

Reference to the column which shows the increase in railway mileage by States during the year covered by this report indicates no very decided localization of railway construction. Fifteen States and one Territory show an increase in mileage in excess of 100 miles and six States an increase in excess of 200 miles. Of this latter class of States three are the contiguous States of Alabama, Mississippi, and Arkansas, which together show an increase of 638.61 miles of line. The contiguous States of Iowa and Minnesota together show an increase of 1,014.48 miles, while the State of California shows an increase of 218.79 miles. The impression gained from the column under consideration, however, is that railway construction in the United States during the year covered by this report is quite evenly distributed.

The second summary of this group gives a territorial distribution of railway mileage. It covers all years of the decade prior to 1900.

In the next summary inserted will be found a statement of the total mileage operated, all tracks. This mileage is classified as single track, second track, third track, fourth track, and yard track and sidings. It must be observed that the mileage stated in this table is that of roads making report of operation, and on this account has no necessary relation to the mileage in the previous tables. It includes mileage operated under trackage rights. The single-track mileage in the following table is accepted as the basis of all traffic assignments in this report.

It will be further noted that the following table differs from the corresponding table in previous reports in that it makes no mention of nonreporting mileage, and the totals for the United States for the

ten years 1890 to 1899, inclusive, have been changed by the exclusion of nonreporting mileage, which was included in the reports of those years:

From the above summary it may be learned that the aggregate length of all tracks operated on June 30, 1900, was 258,784.30 miles, distributed as follows: Single track, 192,556.03 miles; second track, 12,151.48 miles; third track, 1,094.48 miles; fourth track, 829.29 miles, and yard track and sidings, 52,153.02 miles. This shows an increase in operated track mileage during the year of 8,641.79 miles, which, in addition to newly constructed mileage put in operation, is made up of an increase in second track, third track, fourth track, and in yard track and sidings, and in line operated under trackage rights. This increase in operated mileage (all tracks) is larger than that of any other year since 1893.

The increase in yard track and sidings during the year covered by this report is 2,929.37 miles, from which it is evident that the railways have been active in providing greater facilities for increased density of traffic, as well as in the extension of new lines.

Under "Line owned" in the above summary is shown the length of line represented by capital stock; under "Proprietary companies" the length of line of those companies whose entire capital stock is owned by the reporting company; under "Line operated under trackage rights," the length of line not owned, but used in common with another company, by the company making report. The other captions in the table need no explanation.

The length of "Line owned" on June 30, 1900, was 142,242.44 miles, being an increase of 5,885.02 miles during the year. "Line operated under lease" shows an increase of 967.66 miles. There is a decrease,

however, in the "Line of proprietary companies" of 559.88 miles, and in "Line operated under contract" of 1,629.14 miles, which results in a net decrease during the year covered by this report of proprietary lines and lines operated under lease or contract, thus contributing to the explanation of the fact that the increase in owned mileage is in excess of new line constructed during the year. The tendency thus exhibited seems to be in the direction of a substitution of the more simple and direct control of corporate ownership for the indirect control through contract or lease. It is one of the results of the reorganizations and consolidations during the year.

The organization of railway property is further shown by the following summary, which classifies operating and subsidiary roads:

¹ Decrease.

The total number of railway corporations on June 30, 1900, was 2,023, being a decrease of 26 as compared with the previous year. Of this number, 1,067 maintained independent operating accounts, and are classified as operating roads; 732 are subsidiary roads, by which is meant roads which maintain an independent corporate existence, but which are assigned to some other company for operation. The number of private roads included in the above aggregate is 176, of which

157 were operated during the year covered by this report. The changes in organization, so far as these are reflected by the data presented in the above summary, do not seem to call for special comment.

The next summary presents a classification of roads according to organization for operation, by groups:

The above statement shows that 28 roads, with an owned mileage of 3,449.77 miles, have been reorganized during the year; that 36 roads, with an owned mileage of 5,762.41 miles, have been consolidated, and that 89 roads, with an owned mileage of 4,489.78 miles, have been merged. It thus appears that an aggregate of 13,701.96 miles of line have been affected by corporate changes during the year, and in the case of consolidations and mergers, at least, these changes have been in the nature of greater centralization.

The extent to which this centralization has proceeded, as also the trend in this direction since 1890, is roughly indicated in the next summary, which exhibits a classification of railways on the basis of operated mileage. The classification is indicated in the boxing of the summary. It should be noted, however, that the figures presented take no account of the practical centralization of control, due to the fact that several lines which maintain an independent operating existence are brought under the direction of the same body of men. The summary presents the facts as they appear from the reports on file in the Division of Statistics.

⁵ Includes 1,092.80 miles outside of the United States, operated by four roads, as follows: Boston & Maine R. R., 36.75 miles; Michigan Central R. R., 378.91 miles; New Brunswick Ry., 412.90 miles; Northern Pacific R. R., 264.24 miles.

Without undertaking extended comment on the data presented above, it is worthy of notice that on June 30, 1890, railways in excess of 1,000 miles of operated line constituted 47.51 per cent of the aggregate length of line; in 1900 they constituted 60.79 per cent of the aggregate length of line. Corresponding comparisons are rendered possible for the other classes of roads, which, taken together, re in a rough manner the trend toward consolidation.

The number of summaries under "Equipment" in previous reports was considerably greater than the number which find place in this report. This is due to the fact that all of the summaries giving detailed information as to the kinds of couplers or train brakes, as also their distribution by territorial groups, have been discontinued. The emphasis placed heretofore upon the question of safety appliances seemed appropriate in order to show statistically the manner in which the equipment law of March 2, 1893, operated; but in view of the fact that this law seems to be complied with in a fairly satisfactory manner, the details heretofore important have ceased to be significant.

By railway equipment is meant locomotives and cars of all sorts. Locomotives are classified as passenger, freight, and switching locomotives. The fact that in many instances the same type of locomotive is used for the passenger as well as for the freight service renders this classification exceedingly difficult, and it may eventually prove necessary to substitute some other unit for the classification of motive power. For the present, however, the classification is retained.

Cars are classified as cars assigned to the "passenger service," to the "freight service," and to "company's service." "Cars leased," as also "cars assigned to fast freight line service," are included in the

total number of cars in service. This aggregate, however, excludes the cars of private corporations and individuals which are used by the carriers, and for which they pay a rental on a mileage basis. As indicating the amount of this class of property, mention may be made of the fact that, during the year ending June 30, 1900, \$11,196,278.51 is reported by the carriers as having been paid for the use of private cars. Some few roads failed to make report of this item.

¹ Decrease.

The number of locomotives on June 30, 1900, was 37,663, being an increase as compared with the previous year of 960. The corresponding increase for the previous year was 469, making an increase in the total number of locomotives of 1,429 since 1898. This figure represents the net increase in all classes of locomotives. Locomotives assigned to the passenger service show a decrease of 31 during the year. Freight locomotives show an increase of 868, and switching locomotives of 141 during the year covered by this report. The number of locomotives reported as leased on June 30, 1900, was 871, being a decrease of 117 as compared with the previous year. It is significant that the tendency toward the decrease in the number of the leased locomotives has been constant since 1895. In that year the number of leased locomotives was 2,562; on June 30, 1900, it was 871.

The total number of cars the property of roads making report of operations to the Interstate Commerce Commission was 1,450,838, being an increase of 74,922 as compared with the previous year. The corresponding increase for the year ending June 30, 1899, was 49,742, making an increase in cars of 124,664 during the two years in question. This is a marked increase in equipment, and when taken in connection with the fact that the year ending June 30, 1897, showed a decrease in equipment, is significant as measuring roughly the increase in railway traffic. Cars assigned to the passenger service on June 30, 1900, were 34,713, being an increase of 863 as compared with the previous year; cars assigned to the freight service were 1,365,531, being an increase of 70,021 as compared with the previous year. The report of the previous year showed a decrease in cars leased by companies making report of operation, but the present report shows an increase in leased cars of 6,584, the total number of cars leased being 124,413. The number of cars assigned to fast freight line service on June 30, 1900, was 42,771, being a decrease of 2,346 as compared with the previous year.

A simple statement of the number of locomotives and cars gives an inadequate conception of railway equipment; for this purpose it is necessary to assign this equipment to the length of line over which they run and to the traffic which they carry. This is done in the two summaries which follow:

In previous reports the assignment of locomotives and cars has been on the basis of 100 miles of line, but on the basis of so short a mileage changes in equipment failed to find adequate expression. In the present report equipment is assigned on the basis of 1,000 miles of line.

By referring to the first of the above summaries, it appears that the total number of locomotives per 1,000 miles of line on June 30, 1900, was 195, of which 51 were classed as passenger locomotives, 112 as freight locomotives, 29 as switching locomotives, and 3 as unclassified. By comparing these figures with corresponding figures of the previous years, it is observed that the increase in locomotives has not kept pace with the increase in operated mileage, there being in 1894 202 locomotives per 1,000 miles of line and in 1900 195, showing a decrease of 7 locomotives per 1,000 miles of line. In the case of cars, passenger cars show a decrease from 188 per 1,000 miles of line in 1894 to 180 in 1900, but freight cars show an increase from 6,860 per 1,000 miles of line in 1894 to 7,092 per 1,000 miles of line in 1900. The increase in freight cars during the year covered by this report was 184 per 1,000 miles of line. The tendency thus brought to notice is the result of so many considerations, both administrative and engineering, that no detailed explanation is attempted. The tendency itself is significant in its bearing upon the economies of transportation.

From the second of the above summaries it is observed that the passenger miles per passenger locomotive for the year ending June 30, 1900, were 1,626,179, being an increase of 151,414 as compared with the previous year; the ton miles per freight locomotive for the same period were 6,556,731, being an increase of 590,538 as compared with the previous year. This increase, which indicates greater economy in the use of equipment, may be partly explained by the greater size of locomotives and the greater capacity of cars, but it is undoubtedly due in a larger measure to the increased density in passenger and freight traffic. That this explanation is correct may be observed from the fact that the number of passenger cars necessary for carrying 1,000,000 passengers during the year covered by this report was 60, as compared with 65 of the previous year; the number of freight cars per 1,000,000 tons of freight carried was 1,239 for the year covered by this report, as compared with 1,350 the previous year. The figures which appear in the above summary in the column headed "Passengers carried per passenger locomotive" should be accepted with great caution. They are of some use for purposes of comparison, but the difficulty of excluding duplication in passengers reported makes the assignment itself of slight significance. The proper unit of measurement in passenger statistics of this class is the passenger mileage unit. The ton mileage unit, also, should be used in any study made of freight traffic, although it is possible, in the case of freight traffic, to arrive at a very satisfac-

tory statement of the number of tons moved as well as the number of tons moved 1 mile.

It is the design of the summary next introduced to show the number of cars and locomotives fitted with train brakes and with automatic couplers. These data are presented for all the years including and subsequent to 1889, and it is possible to learn from this summary not only the extent to which equipment is supplied with these automatic safety appliances, but the rapidity with which these appliances have been added from year to year.

¹ Decrease.

By referring to the data presented above it appears that out of a total of equipment, including engines and cars, of 1,488,501, the number fitted with train brakes on June 30, 1900, was 1,005,729, and the number fitted with automatic couplers was 1,404,132.

When the great variety of cars is taken into consideration, as also the usage to which they are put, it seems from the above statement that for all practical purposes the safety-appliance law of 1893 has been complied with. This statement, however, assumes that the types of coupler and brake used conform to the requirements of the law.

In the four summaries which follow will be found a classification of locomotives and cars fitted with train brakes and automatic couplers, as also a distribution of the equipment thus supplied, by territorial groups:

It is the design of the next summary to present a useful exhibit relative to safety appliances. It is confined to cars, excluding locomotives, and shows the number of cars on June 30 which are supplied with train brakes and automatic couplers, as also the number which fails to be supplied, and by a classification of cars indicates what class yet remains to be fitted out with safety appliances.

MEN EMPLOYED ON RAILWAYS.

1. Summary of Employees, by Classes.
2. Classification of Employees, by Groups.
3. Distribution of Employees, by Class of Work.
4. Average Daily Compensation of Railway Employees.
5. Total Amount of Compensation Paid Railway Employees.

Under railway employment there are two questions which statistics undertakes to answer. The first pertains to the number of men employed in transportation and the relation which this number holds to the length of line operated and to the traffic carried. The other pertains to the classification of railway employees and the average amount paid for their service in the several classes of employment. From the point of view of the railway manager, these data, kept in a uniform manner from year to year, are significant when placed in comparison with the amount received for traffic; it is of importance to the railway employee as indicating the trend in average wages in the railway service. The facts submitted in the following summaries, taken in connection with other summaries in this report, lead to reliable conclusions upon these questions. The first of these summaries gives the number of men in the employ of the railways of the United States on June 30, 1900, under the several classes named, as also the number per mile of line operated.

The year covered by the present report is the first year in the history of American railways in which the number of men employed exceeds 1,000,000, the exact number being 1,017,653. As compared with the previous year, this shows an increase of 88,729. The corresponding increase for the year ending June 30, 1899, as compared with the previous year, was 54,366. The increase in railway employees for the three years prior to June 30, 1900, being a period of revived industry following a period of industrial depression, was 194,177.

The number of men in the employ of the railways per 100 miles of line on June 30, 1900, was 529, the corresponding number in the previous report being 495. In last year's report attention was called to the fact that notwithstanding the increase in traffic, the number of men employed on the railways of the country per 100 miles of line was not as great as in 1893, being the last year of the previous period of prosperity, and this fact was referred to as indicating that the economies rendered necessary by the hard times resulted in a permanent advantage to the railways and to the public. It will be noted that the number of men employed per 100 miles of line on June 30,

1900, exceeds the number employed in 1893. But reference to the increase in passenger and freight traffic shows that notwithstanding this marked increase, employment has increased at a rate less rapid than the increase in traffic. Thus, in 1893, the aggregate number of men employed was 873,602, while the number of tons of freight moved one mile for the same year was 93,588,111,833, which shows the movement of 107,129 ton-miles of traffic per employee. The ton-miles accomplished during the year covered by this report were 141,599,157,270, or 139,143 ton-miles per employee. If this traffic be assigned to the number of enginemen, the point under consideration receives yet greater emphasis. The ton mileage accomplished per engineman in 1893 was 2,413,246 miles; the ton mileage accomplished per engineman in 1900 was 3,305,534 miles.

The next summary presents a classification of employees by territorial groups, and shows also the total number of employees in each group. This latter item is given for all the years from 1890 to 1900, inclusive.

In the annual reports of carriers railway employees are classified so as to show employment under the four general headings prescribed by the official classification of operating expenses. The next summary is a compilation of these assignments, and shows the number of men employed in "General administration," in "Maintenance of way and structures," in "Maintenance of equipment," and in "Conducting transportation." The totals for the United States for all years from 1890 are also included.

The summaries next introduced pertain to wages, and the first of them exhibits the result of a uniform computation of average daily compensation for employees in the various classes of employment indicated for all years subsequent to 1891. It may be proper to submit a word of explanation relative to the data presented. The practice of American railways recognizes two measurements for a day's work. The one is the number of hours per day; the other is the amount of work accomplished. In the case of the men engaged in the movement of trains, the measure of a day's work is the number of miles run. In some cases 80 miles constitute a day's employment for an engineer or a fireman; in others 100 miles. In some few cases

120 miles are accepted as the proper measurement of a day's work; but whatever the distance agreed upon the average daily compensation for this class of employees means the amount received for carrying a train over the distance designated. This being the case, it is evident that the average daily compensation of a locomotive engineer can not be compared with that of a machinist or a carpenter paid on the basis of time. In the case of shop employees, also, a similar condition presents itself, since some of these employees are paid by piece-work; others are regularly employed at a given sum per month, per day, or per hour. In this case, however, there is no serious difficulty in the matter of comparison, because the conditions of employment are such that the rates of pay tend to equalize themselves for a given amount of service, whether computed by the piece or by the day. It seems proper to make this explanation in order to obviate the erroneous conclusions which might arise should a comparison be made between the average rate of compensation to trainmen and to other classes of employees; and, with this explanation, the summaries which show the rate of compensation for the United States, as also for ten territorial groups into which the country is divided, are inserted without further comment.

By referring to the figures in the above statement, it appears that the aggregate compensation paid by the railways for labor during the year ending June 30, 1900, was \$577,264,841, being an increase as compared with the previous year of \$54,296,945. The aggregate of operating expenses for the year was \$961,428,511, from which it appears that about 60 per cent of the aggregate of operating expenses goes to the payment of labor. It is interesting to note that of this amount, enginemen receive \$50,713,401, firemen receive \$29,203,596, conductors receive \$30,089,322, station agents receive \$18,553,252, and trackmen, exclusive of section foremen, receive \$71,664,298. These figures represent the income of the several classes of employees, and indicate more clearly than can be done in any other single statement the degree of interest which these several classes of employees have in a conservative and efficient management of the railway industry. It is upon annual incomes approximating these figures that the organizations of railway employees rest.

For the purpose of localizing the compensation of railway employees, the following summary is introduced, which assigns to the ten territorial groups the aggregate figures in the foregoing summary:

CAPITALIZATION AND VALUATION OF RAILWAY PROPERTY.

1. Summary of Railway Capital, by Groups.
2. Ownership of Railway Capital.
3. Stocks and Bonds Owned by Railways, by Groups.
4. Classification of Railway Capital by Rate of Dividend or Interest.
5. Charges against Income on Account of Railway Capital.

The set of summaries next presented show what is commonly called railway capital, by which is meant the par value of stocks, bonds, and indebtedness of all sorts, current liabilities (which for the year covered by this report amount to \$594,787,870) alone being excluded. It should be noted that this is the commercial use of the phrase "railway capital." It is not what the economist terms capital, nor should the figures here presented be accepted as measuring the value of the property. To measure the value of railway property, should that for any reason be desired, would require an investigation extending beyond the scope of the annual reports furnished by carriers to the Commission. Railway capital in the following summaries means railway securities.

¹ See note 2.² Excludes "Other forms of indebtedness," which was included in the corresponding items for years previous to 1896.

The aggregate amount of railway securities reported by the carriers as outstanding on June 30, 1900, was \$11,491,034,960, being an increase as compared with the previous year of \$457,080,062. If this increase be added to the increase in railway securities during the years ending June 30, 1899 and 1898, it appears that the increase in railway securities during the three years previous to June 30, 1900, was \$856,026,886. Confining comment to the year covered by this report, it is pertinent to notice that the increase of \$457,080,062 in railway securities is synchronous with an increase in mileage of 4,051.12 miles. It can hardly be claimed that the issue of securities for the construction of this new mileage would exceed \$120,000,000, which would leave an increase of \$337,080,062 to be explained in some other manner. Whether facts of this sort be regarded in their bearing upon the adjustment of rates or as a question of equity in the conduct of a quasi-public business, they certainly present a problem in which the public has a legitimate interest.

The amount of stock outstanding on June 30, 1900, was \$5,845,579,593, of which \$4,522,291,838 existed in the form of common stock and \$1,323,287,755 in the form of preferred stock. The increase in common stock during the year covered by the report was \$198,990,869.

The outstanding funded indebtedness at the close of the year covered by this report was \$5,645,455,367, a classification of which is stated in the summary. The amount of funded indebtedness reported this year exceeds the amount reported for the previous year by \$126,512,195. It is a significant fact, and not entirely in harmony with the trend of previous years, that the increase in stock is more than two and a half times as great as the increase in funded indebtedness. Ordinarily this would be regarded as a healthful tendency, but this can hardly be so interpreted in the present instance, in view of the fact that the increase in bonded indebtedness alone is in excess of the probable cost of railway construction during the year.

In the summary now inserted will be found a statement of the amount of stocks and bonds owned by railway corporations in their corporate capacity.

¹ Decrease.

By referring to the above summary it is observed that out of a total of \$10,746,206,416 railway securities outstanding on June 30, 1900, \$1,943,050,349 were owned by railways in their corporate capacity. The corresponding figure for the previous year was \$1,601,913,167, which shows an increase in corporate ownership of railway securities during the year of \$341,137,182. When it is observed, as may be read from the summary, that the corresponding increase for the year 1899 over 1898 was \$80,526,912 and the increase of 1898 over 1897 was \$54,450,079, the significance of the increase during the year covered by this report becomes apparent. It is one of the results of the more perfect organization of railway properties. The increase of the corporate ownership of bonds during the year covered by this report was \$78,416,509, while the increase in the corporate ownership of stocks was \$262,720,673. This fact seems to indicate that the object of corporate purchase of railway securities was control as well as investment.

The next summary shows the corporate ownership of stocks and bonds by territorial groups.

Closely allied to a statement of the amount of railway stocks and railway bonds stands the question of the amount of dividends and interest paid upon them. The amount paid in dividends during the year covered by this report was \$139,597,972, and the amount paid in interest on funded debt was \$252,949,616, making an aggregate of \$392,547,588 paid to the holders of railway securities, exclusive of \$4,912,892 paid as interest on current liabilities. The several rates of dividend or interest which result in the payment of such large amounts are of peculiar interest. A classification of stock and of funded debt at the rates named will be found in the summary now inserted.

By referring to the above summary, it will be observed that of the total amount of railway stocks outstanding, \$3,176,609,698, or 54.34 per cent, paid no dividend. The corresponding percentage for the previous year was 59.39 per cent, showing a slight betterment in this regard. The largest amount of dividend-paying stock is found in the class paying from 4 to 5 per cent. This class accounts for \$851,303,908, or 14.56 per cent of the aggregate amount of outstanding stock. The amount of stock included within this class in the previous year was \$432,229,600, or 7.84 per cent. This is the most considerable change in the shifting of the rate of dividend recorded during recent years, and affords some statistical warrant for the conclusion that a rate of dividend from 4 to 5 per cent is coming to be regarded by boards of directors as a fair return. A comparison of this summary with the

corresponding summary of the previous year shows a decrease in the amount of stock paying a rate of dividend from 5 to 6 per cent, notwithstanding an increase in the amount of dividends paid, thus strengthening the conclusion suggested above.

A classification of the rate of interest paid upon bonds of all classes also points in the same general direction. The amount upon which no interest was paid during the year covered by this report was \$378,937,806, or 6.78 per cent of the aggregate amount outstanding. The previous report shows no interest to have been paid upon 10.45 per cent of the amount outstanding. A comparison of the percentages in the above summary with the percentages of the previous year, shows that a rate of interest from 3 to 4 per cent was paid upon 22.95 per cent of the outstanding funded debt as against 19.77 per cent for the previous year; a rate of interest from 4 to 5 per cent was paid upon 32.82 per cent of the outstanding funded debt as against 26.19 per cent the previous year, and that a rate of interest from 5 to 6 per cent was paid upon 15.60 per cent of the outstanding funded debt as against 18.47 per cent the previous year. As between these two years, the figures show a decided lowering in the rate of interest and dividends paid, a fact which must of course be taken into account when considering the increase in the amount of capital stock and funded debt in excess of what is warranted by the construction of new line. The summaries remaining in this general division are inserted without further comment.

FREIGHT TRAFFIC MOVEMENT.

The basis of freight traffic is the commodities to be carried, and the character of that traffic is largely determined by the relative amount of the various classes of commodities offered for transportation.

In the following summary will be found a statement of the amounts of freight carried during the year ending June 30, 1900, classified as Products of Agriculture, Products of Animals, Products of Mines, Products of Forest, Manufactures, Merchandise, and Miscellaneous. The subdivisions of these general headings provide for thirty-eight separate classes of commodities. The summary also shows the amount of freight originating on the line of the companies reporting, and the amount received from connecting roads and from other carriers. This separation is necessary in order to avoid the duplication of freight tonnage.

The total amount of freight tonnage reported by the carriers for the year ending June 30, 1900, was 1,101,680,238 tons; of this amount 957,863,605 tons were classified by commodities, but it should be held in mind that the above summary deals with 87 per cent only of aggregate tonnage. The amount returned by the carriers as originating on

the line of the reporting companies during the year ending June 30, 1900, was 516,432,217 tons, and it is this figure, or rather this figure increased by its proper proportion of unclassified tonnage, which, as shown on page 67, amounts to 593,970,955 tons, that should be accepted as the true measure of the amount of traffic handled.

The facts contained in the above statement are brought into smaller compass in the summary now inserted. It includes only the totals of the grand divisions of commodities, which are given for the United States as a whole, and for the three grand territorial divisions as indicated.

It is the tonnage originating on the line of the carrier making report that is used as the basis of this distribution, tonnage received from connecting roads and other carriers being excluded.

Products of mines furnishes by far the largest amount of tonnage. The number of tons carried during the year covered by this report was 271,602,072, or 52.59 per cent of the aggregate. This is perhaps the lowest grade of freight carried. It would be interesting to know what portion of gross earnings is contributed by this class of freight, but unfortunately the present form of report does not call for a classification of freight earnings. Products of agriculture furnished 53,468,496 tons, or 10.35 per cent of the aggregate. The other statements in the summary are equally significant, but they may be read from the table as well as from the text.

² Decrease.

Omitting reference to the number of passengers carried on account of the necessary duplication in the compilation of these figures, attention is directed to passenger mileage. The number of passengers carried 1 mile during the year covered by this report was 16,039,007,217,

being an increase as compared with the previous year of 1,447,679,604. This figure stands for the increase in the quantity of passenger traffic. The density of passenger traffic is measured by assigning passenger mileage to a mileage basis. By referring to the above summary, it is seen that the number of passengers carried 1 mile per mile of line during the year ending June 30, 1900, was 83,295, being an increase as compared with the previous year in passenger density of 5,474.

The number of tons of freight carried during the year covered by this report, including duplications on account of the fact that some freight is reported by two or more lines, was 1,101,680,238, being an increase as compared with the previous year of 141,916,655. This figure has been continued for purposes of comparison. It is not in itself correct. The number of tons of freight carried during the year covered by this report, excluding duplications, was 593,970,955, being an increase as compared with the previous year of 83,891,755 tons. The ton mileage for the year ending June 30, 1900, aggregates the enormous figure of 141,599,157,270, being an increase as compared with the previous year of 17,931,900,117. The density of traffic has likewise increased. For the year ending June 30, 1900, the number of tons of freight carried 1 mile per mile of line was 735,366, being an increase of 75,801 as compared with the previous year. When one considers the increase in passenger mileage and ton mileage and learns that the average rate per ton per mile is greatly in excess of the previous year, he is prepared for a large increase in gross earnings during the year covered by this report.

The train mileage figures demand a word of explanation. Passenger train mileage shows only a slight increase, while freight train mileage shows an apparent decrease. This, however, is due to a change in the method of compilation. In all previous reports, passenger train mileage included 25 per cent of mixed train mileage, and freight train mileage included 75 per cent of mixed train mileage. In this report, however, passenger train mileage and freight train mileage are given without the addition of mixed train mileage, mixed train mileage being included in the total revenue train mileage, which latter item is introduced as an independent item for the first time in this summary. These changes were rendered necessary by a rule for computing certain averages pertaining to passenger and to freight traffic, adopted at the Eleventh Annual Convention of Railroad Commissioners.

Inasmuch as future reports will conform to the new rules for passenger, freight, and mixed train mileage, it may not be inappropriate to insert at this point a statement of the averages affected, showing what these would be, computed by the old rule and by the new rule. The old rule, as already explained, increased passenger mileage by 25 per cent of mixed train mileage, and freight train mileage by 75 per cent of mixed train mileage, in order to arrive at a

basis for all computations. The new rule adds the total of mixed train mileage to passenger and freight train mileage, respectively, to arrive at such a basis.

For the purpose of bringing all the items affected into a single statement, the following table includes not only the average number of passengers in a train and the average number of tons in a train, which find place in the summary under consideration, but the revenue per passenger train mile and the revenue per freight train mile, found on page 95 of this report.

The income account of railways is presented in two ways: First, on the assumption that the railways in the United States are part of a single system, in which case there can be no duplications on account of intercorporate payments; second, in conformity with the reports of the carriers as rendered, in which case numerous duplications, both of income and expenditure, find their way into the statements. While the final result of the two systems of compilation is the same, because duplications of income in the second statement are offset by duplications of expenditures, it is to the first statement, however, that one should turn for a correct impression of the earnings and expenditures of railways during the year covered by this report.

¹ Decrease.

² This amount comprises the following items: Permanent improvements, \$25,500,035; advances to cover deficits in operation of weak lines (estimated), \$5,000,000; miscellaneous deductions, \$24,596,390; surplus, which is shown in summary on page 74, \$87,657,933.

³ This amount comprises the following items: Permanent improvements, \$13,070,045; advances to cover deficits in operation of weak lines (estimated), \$5,000,000; miscellaneous deductions, \$21,584,191; surplus, which is shown in summary on page 74, \$53,064,877.

A word of explanation may be appropriate in connection with the figures presented above. Gross earnings from operation, being taken from the reports of operating lines, admit of no duplication and are the same in the above statement as in the income account compiled from the reports of both operating and subsidiary lines. The second item, "Clear income from investments," is given in the above table as \$32,526,016, while the amount included in the condensed income account which follows, as income from sources other than operation, less rentals received, was \$63,455,452.¹ This reduction is due to the fact that certain railways have received during the year \$20,978,105 as dividends on stocks of other railway corporations and \$9,951,331 as interest on bonds of other railways. To balance this reduction in income the total

¹ See summary, p. 82.

amount of interest reported as paid during the year is reduced by the amount paid to railway corporations, and the total amount of dividends reported as paid is reduced by the amount of dividends received. The most significant of these items is dividends. The amount of dividends shown in the above summary for the year covered by this report is \$118,624,409. This represents the money paid by railways during the year to individuals and corporations other than railway corporations. It is the net amount of dividends paid. The aggregate amount of dividends paid, as shown by compiling the dividends reported by all railways, both operating and subsidiary, was \$139,602,514, including \$4,542, other payments from net income. The difference, as already suggested, represents the dividends received by railways on railway stocks which they hold in their corporate capacity.

The above income account of the railways of the United States, considered as a system, is made comparative for the years 1899 and 1900, and the columns showing the increase and decrease in its several items are perhaps the best indication of the financial prosperity of American railways found in this report. Reading from this statement, it appears that the aggregate gross earnings from operation during the year were \$1,487,044,814, being an increase of \$173,434,696 as compared with the year 1899, which, it will be remembered, was regarded as a most prosperous year. The increase in operating expenses during the same period was \$104,459,512, thus leaving a net increase resulting from the operations of the year of \$68,975,184. Salaries and maintenance of leased lines show a decrease of \$75,090, which may be regarded as one of the results of the consolidations and mergers which have taken place. The increase in net interest on funded debt is relatively slight, being \$1,340,750, while the interest paid on current liabilities during the year as compared with the previous year shows a decrease of \$2,189,955. Taxes for the year covered by this report amounted to \$48,332,273, showing an increase of \$1,994,641. The amount available for dividends, adjustments, and improvements during the year covered by this report was \$261,378,767, an increase as compared with the previous year of \$74,385,858. The net dividends paid, as already stated, were \$118,624,409. This is the largest amount of net dividends ever paid, and exceeds the amount paid during the previous year by \$24,350,613. The final figure in the above statement is perhaps the most significant. It shows the amount available for adjustments and improvements, or perhaps more accurately stated, the amount placed at the disposal of the boards of directors to be used in whatever manner they deem wise. For the year ending June 30, 1900, this fund reached the sum of \$142,754,358, being an increase as compared with the previous year of \$50,035,245. It is for the purpose of obtaining access to this fund of unappropriated income that much of the speculation in railway securities has been undertaken, and that

many of the schemes for financing railway properties have been set on foot.

The summaries which follow include the income and expenditures of both operating and subsidiary roads. The first of these summaries is a condensed income account, made comparative for the years 1890 to 1900, inclusive.

When it is noticed that for the three years ending June 30, 1894, 1895, and 1897, the railways of the United States closed with a deficit, and for the year ending June 30, 1893, the surplus was reduced to \$8,116,745, and for the year ending June 30, 1896, it was reduced to \$1,534,169, the significance of the surplus for the year covered by this report becomes apparent. For the purpose of a more perfect comparison of the items in the above summary these items are assigned in the summary which follows to a mileage basis.

The average gross earnings per mile of line on all the railways of the United States for the year ending June 30, 1900, was \$7.722. Comparing this figure with the corresponding figures of previous years, it will be observed that the gross earnings per mile of line for the year ending June 30, 1900, exceed those of any previous year, the one year which approaches it being the year ending June 30, 1892, when the average earnings per mile of line amounted to \$7.213. The increase in average earnings per mile of line for the year covered by this report, as compared with the previous year, was \$717. The increase in operating expenses was \$423, which shows an increase in net earnings of \$294 per mile of line. The dividends per mile of line for the year covered by this report were \$725, being \$133 per mile of line in excess of dividends declared the previous year, and also in excess of the dividends declared during any year since 1890. The surplus assigned to the mileage basis gives a surplus of \$455 per mile of line.

In the next summary will be found a condensed statement of earnings and expenses by territorial groups. Its purpose is to localize the items presented in the income account, and by their assignment to a mileage basis to enable comparison between the financial conditions of railways in different parts of the country.

Railways derive their earnings from two main sources—the passenger service and the freight service. Under the passenger service are included the transportation of passengers, of mail, of express, and other services incidental to passenger traffic.

By referring to the above it is seen that passenger revenue for the year covered by this report amounts to \$323,715,639, an increase of \$32,602,646 as compared with the previous year. The Government contributed to railways during the same period \$37,752,474 for transporting the mail, and the express companies paid \$28,416,150 for carrying express matter. The amount received by the railways during the same period for the transportation of freight was \$1,049,256,323, being an increase as compared with the corresponding figure for the previous year of \$135,519,168. The relative significance of these several services to the railways is shown in the column headed “Proportion to total earnings.” For the year covered by this report, it appears that passenger revenue contributed 21.77 per cent to the gross earnings of railways, while freight revenue contributed 70.56 per cent. The passenger service, including mail and express, for the same period contributed 26.77 per cent, and the freight service contributed 70.78 per cent. It can not be said that these percentages measure accurately the relative importance of the passenger service and the freight service in railway administration, because each of these services is in a degree dependent upon the other; they do, however, have a direct bearing upon the rules which govern railway administration.

The summary next inserted classifies the items of earnings and income by territorial groups.

In the analysis of earnings given above there is an item, "Income from other sources." This covers the rentals received by subsidiary roads for the lease of their property, the dividends declared on stocks, the interest paid on bonds owned by railways in their corporate capacity, and certain miscellaneous classes of income. It is the purpose of the following summary to show the amounts received from these sources, and to assign these amounts to the ten territorial groups.

¹ Decrease.

The total of income from other sources than operation during the year ending June 30, 1900, was \$162,885,071, of which \$99,429,619 was received as rentals from leased property, \$24,490,253 as dividends on stocks owned, and \$11,833,974 as interest on bonds owned, the remainder being miscellaneous. The income from investments should not, however, be accounted a clear income to the railways, because of the fact, already stated, that \$20,978,105 reported as dividends on stocks were dividends declared on railway stocks, and \$9,951,331 of the interest received on bonds was interest which accrued on railway bonds. If these two amounts be deducted, it will be seen that the clear income to the railways from the lease of their property and from investments during the year covered by this report was \$131,955,635. In this connection it is worthy of remark that some of the railways of the United States have investments which bear an income approximating the interest which accrues on their outstanding obligations. The

stock in such companies represents proprietorship in an unincumbered property.

The next step in the analysis of the income account pertains to operating expenses. In the summary following will be found a classification of operating expenses under the four general headings—Maintenance of way and structures, Maintenance of equipment, Conducting transportation, and General expenses.

⁵ Decrease.

Without reciting in the text the several amounts presented in the above summary, attention is called to the radical changes in the amounts contributed to the four classes of expenditures during the year ending June 30, 1900, as compared with the previous year. Maintenance of way and structures, which claims normally from 20 to 22 per cent of operating expenses, shows an increase of \$30,809,715—that is to say, an increase of 17.08 per cent as compared with the previous year. Maintenance of equipment, which claims normally from 16 to 19 per cent of operating expenses, shows an increase during the year covered by this report of \$30,254,631—that is to say, an increase of 20.05 per cent as compared with the previous year. The

aggregate increase in Conducting transportation, which claims normally from 54 to 57 per cent of operating expenses, was \$42,956,719, being an increase of only 8.84 per cent as compared with the previous year. The significance of these facts is that the directors of railways during the year covered by this report have availed themselves of high net earnings to make permanent improvements in roadway and rolling stock, and have charged these improvements as operating expenses.

The summaries next inserted present a corresponding analysis of operating expenses for the ten territorial groups.

In the next summary will be found an analysis of fixed charges. This phrase "fixed charges" is not found in the annual reports made by carriers, and is here used as a convenient expression covering a number of items more or less closely related to each other. It is in connection with these items that the duplication already referred to arises, which results from combining the reports of operating and subsidiary lines in a single statement. For the purpose of obviating any erroneous use of the figures here presented, the amount which an operating company pays to subsidiary lines, which is again paid out by them under another form, is inserted in the following summary in bold-face type.

It will be observed from the above summary that the railways in the different parts of the country vary greatly in the character of their operation, as indicated by their relative dependence upon the passenger and freight traffic. The average for the United States as a whole shows that 26.77 per cent of gross earnings from operation are assignable to the passenger traffic and 70.78 per cent to the freight traffic.

In Group I, the New England group, the corresponding percentages are 44.19 and 54.83. In Groups II and III, which, speaking broadly, include the trunk-line territory east of Chicago, these percentages are about the same as those for the country as a whole, showing, however, slightly increased dependence upon the freight traffic. In Groups VI, VII, and VIII, on the other hand—that is to say, the territory lying between Lake Michigan and the Rocky Mountains north of the Texas line—the percentages show a relatively greater dependence upon freight and a correspondingly decreased relative dependence upon passenger traffic. It must not, however, be assumed that correspondence in these ratios indicates similarity in the conditions under which transportation is carried on. Thus, the relative dependence upon freight and passenger traffic for the States of West Virginia, Virginia, North Carolina, and South Carolina are about the same as for the States of Maryland, Delaware, New Jersey, Pennsylvania, and New York; but, as is well known, the density of traffic differs very greatly in the two groups of States mentioned. For a satisfactory impression of traffic conditions in any particular territory all of the facts pertaining to transportation must be taken into the account.

One of the significant percentages in railway economics is the percentage of operating expenses to operating income. This also will be found in the above summary, both for the United States and for the ten territorial groups. It should, however, be said in this connection that the liberty which the Commission grants the railways of charging permanent improvements into operating expenses deprives this test of railway administration of much of the value which it would otherwise have.

3. Summary of Results, by Groups—Freight Service.

In the following summaries will be found certain averages pertaining to revenue and cost which bear directly upon the general question of railway economics. The first of these relates to the United States as a whole, and is made comparative for the years 1890 to 1900, inclusive.

The average revenue per passenger per mile during the year covered by this report was 2.003 cents, being an increase for average receipts per passenger per mile of 0.078 cent. The average revenue per ton per mile for the same period was 0.729 cent, being an increase from 0.724 cent of the previous year. These figures show a temporary arrest, at least, of the general trend toward a reduction of the average receipts from passenger and freight traffic. The average revenue per passenger-train mile stands in the above statement as \$1.01.075, and the average revenue per freight-train mile stands as \$2.00.042. In considering these figures it must be held in mind that they are the result of the new rule of computation referred to on page 69. Computed according to the rule followed for June 30, 1899, the average revenue per passenger-train mile during the year covered by this report was \$1.06.656, and the average revenue per freight-train mile for the same period was \$2.02.720. It is these figures, rather than those which appear in the above summary, which should be placed in comparison with previous years. Another indication of satisfactory administration during the year covered by this report is found in the reduction of the percentage of operating expenses to operating income,

it being, for the year ending June 30, 1900, 64.65 per cent, which is lower than any point during the ten years placed in comparison.

In the next summaries will be found a statement of these items classified by territorial groups.

GENERAL BALANCE SHEET.

The purpose of a general balance sheet is to show the financial standing of the business to which it pertains on the date for which it is drawn. In railway accounts, as organized in the United States, the balance sheet contains few items, and is entirely separate from the income account, the purpose of which is to show the income and expenditures for a definite period, except so far as it incorporates the surplus or the deficit of the income account with "profit and loss."

The number of miles represented by the balance-sheet statement has universally been less in these reports than the mileage for which satisfactory reports of operation have been rendered. The present balance sheet covers 181,437.01 miles of line. It is made comparative with the previous year by inserting the increase or decrease for each item presented. The figures are self-explanatory, and the summary is presented without comment.

TAXES.

On page 73 of this report it was stated that the aggregate amount paid in taxes by railways of the United States during the year covered by this report was \$48,332,273. The significance of this amount as a payment from the railways and as a receipt to Federal, State, and local governments, as also the interest which centers in the general question of railway taxation, warrants a special study of this general question. As introductory to this study, which will continue from year to year, there is given below a statement showing taxes and assessments of railways, classified by States and Territories. Further analysis of this item of expenditure may be expected in subsequent reports.

¹ This summary does not include taxes paid to the United States Government under the recent internal-revenue act, nor small amounts not apportioned by States.

The above summary relates exclusively to State and local taxes; it does not include the internal-revenue tax. It is interesting chiefly on account of the widely varying amounts which States obtained from this source, a fact which appears more clearly in the statement of the amounts paid per mile of line than in the aggregate amounts paid. In South Dakota, for example, the amount of taxes paid per mile of line was \$72.17; in Massachusetts, on the other hand, the amount paid in taxes per mile of line was \$1,411.93. The facts presented in the above summary make it evident that there is as great diversity in the results of taxation in the several States and Territories as in the laws which provide for the levy and collection of taxes.

RAILWAY ACCIDENTS.

Statistics of railway accidents have always held a prominent place in this report. They show not only the aggregate number of casualties during the year covered by this report and for previous years since 1888, but they classify these casualties according to the kinds of

accidents from which they result, and, in the case of casualties sustained by employees, assign them to the several classes of employees most liable to the several kinds of accidents named.

The total number of persons killed during the year covered by this report was 7,865; the total number injured, 50,320. The number of employees killed during the year was 2,550, and the number injured, 39,643. The number of passengers killed during the year was 249, and the number injured, 4,128. This leaves assigned to "other persons" a total of 5,066 killed and 6,549 injured. From these statements it appears that the number of casualties during the year covered by this report exceeds the casualties for any previous year for which this office has record; but when the increase in the number of employees, as also the increase in both the passenger and freight traffic, is taken into account, it can not be said that the railways of the country are managed with greater disregard to safety than in previous years.

It is the purpose of the next summary to show the number of trainmen, of switchmen, flagmen, and watchmen, of other employees, of passengers, and of other persons killed or injured during the year covered by this report as the result of the kinds of accidents named.

The accident statistics of the present year, as of the previous years, show that the largest number of accidents are sustained by men who have to do with trains. Out of a total of 2,550 employees killed during the year, 1,396 belonged to this class, and out of a total of 39,643 injured, 17,571 are classed as trainmen. The largest number of fatalities have resulted from falling from trains and engines, this kind of accident resulting in 529 killed and 4,425 injured. Of trainmen, 412 were killed falling from trains and engines and 3,359 injured. The largest number of casualties to employees results from coupling and uncoupling cars and locomotives. Of the total number of employees, 282 deaths occurred from this cause and 5,229 injuries. Of trainmen, 188 were killed coupling and uncoupling cars and locomotives and 3,803 were injured. Collisions and derailments also are a prolific source of casualties. Collisions are responsible for 264 deaths and 1,576 injuries, derailments are responsible for 197 deaths and 877 injuries. The corresponding statement for trainmen shows that 224 trainmen were killed and 1,248 trainmen injured by collisions, and that 156 trainmen were killed and 619 trainmen injured by derailments. The number of passengers killed during the year was 249 and the number

injured 4,128. Of the fatal casualties to passengers, 65 resulted from collisions, 23 from derailments, and 34 at stations; of the total number of injuries sustained by passengers, 1,263 resulted from collisions, 480 resulted from derailments, and 646 at stations.

Among the kinds of accidents noted are accidents at highway crossings. These are of relatively slight importance to employees or passengers, but become very serious when the casualties sustained by other persons are taken into account. Exclusive of passengers, the number of persons killed at highway crossings during the year covered by this report was 729, and the number injured 1,294. Of the number killed, 171 were reported as trespassing and 558 as not trespassing; of the number injured, 204 were reported as trespassing and 1,090 as not trespassing. Figures of this magnitude suggest the necessity of greater legislative safeguards for the protection of the public at highway crossings.

The summary which follows presents a classification of accidents to employees, passengers, and other persons, by territorial groups.

The first column in the above summary refers to the United States, the following to the ten territorial groups. Confining comment to the United States, it appears that 1 employee is killed for each 399 employees, and 1 employee is injured for each 26 employees. This indicates a higher rate of casualty than was shown in the report of the previous year, the corresponding figures being 1 killed for each 420 employees, and 1 injured for each 27 employees.

Referring to trainmen, the summary shows that 1 employee engaged in the movement of trains was killed for each 137 employees, and 1 injured for each 11 employees. The corresponding figures for the previous year were 1 killed for each 155 trainmen employed, and 1 injured for each 11 trainmen employed.

In last year's report attention was called to the fact that casualties tend to increase with density of traffic. The statistics of the present year also seem to support this conclusion.

The number of passenger miles for 1 passenger killed during the year ending June 30, 1900, was 64,413,684, and the number of passenger miles for each passenger injured was 3,885,418. These figures seem to suggest the liability to death and injury to which passengers are exposed.

No comment will be made upon the corresponding computations for the ten territorial groups. The statistics for the year covered by this report are, in general, the same as those of previous reports, and indicate that railways in certain sections of our country are administered with much higher regard to safety than in other sections of the country. Quite a number of explanations might be submitted for this fact.

The summaries which follow present in yet greater detail statistics of accidents occurring during the year covered by this report.

It seems unnecessary to repeat in this report the recommendations which have found expression in previous reports. They refer to annual reports from express companies engaged in interstate traffic, from carriers by water so far as their business is interstate traffic, and from corporations and companies owning rolling stock used in interstate commerce. The jurisdiction of the Commission must be extended to these agencies of transportation, so far at least as annual reports are concerned, before it is possible to render a comprehensive report upon interstate traffic.

In the Appendix to this report will be found a statement of the number of roads in the hands of receivers on June 30, 1900.

It is desired to make formal recognition of the services of Mr. Walter E. Burleigh, Assistant Statistician, to whom the success of the work in this Division is largely due.

Respectfully submitted.

HENRY C. ADAMS,

Statistician to the Interstate Commerce Commission.

APPENDIX.

TABLE I.

**CLASSIFICATION OF RAILWAYS
AND MILEAGE**

FOR

THE YEAR ENDING JUNE 30, 1900.

EXPLANATORY NOTE.

The established custom of tabulating statistics by territorial groups is continued in this report. "Supplement A," pages 250 and 251, contains totalized figures for certain roads lying in more than one group.

In this table all independent operating roads appear in alphabetical order, printed flush, while subsidiary roads, whether making operating or financial reports, are indented, being also alphabetically arranged. Such subsidiary roads as operate their own and possibly other roads for the leading road of the system are so arranged, however, after a preceding alphabetical arrangement of the subsidiary roads the operations of which are included in a report of the leading road. For illustration, see pages 152 to 158, Nos. 509 to 586, both inclusive. A subsidiary road may have in a subsidiary relation to itself another road, which will appear indented to the second place, and if some road be subsidiary to the last-named company, this third road will be still further indented. For illustration, see page 152, No. 509, Pennsylvania Railroad Company, which appears printed flush as the principal road in an operating system, and under it, as subsidiary, on page 156, No. 574, the Philadelphia, Wilmington and Baltimore Railroad Company, "indented." No. 580, the Philadelphia and Baltimore Central Railroad Company, is subsidiary to the last-named company, and "indented to second place," and this road has subsidiary to itself No. 581, the Chester Creek Railroad Company, which is "still further indented." This arrangement shows the proper relation of any road to the immediate road or roads preceding, and this plan has been followed throughout all tables of the report. The form of relation existing between subsidiary companies and the road by which they are controlled is stated in column 6 of this table. In the subsequent tables the roads have abbreviated names, but the same numbers as in Table I. The only exception to this statement is found in "Supplement B," pages 252 to 261, inclusive, where the numbers of roads given are those of the same roads as used in the Twelfth Annual Report, the roads having ceased to have a corporate existence during the year covered by this report and therefore not appearing in Table I proper. Some of these roads appear in Table II and tables following, with the same "No." printed in bold-face type, for the purpose of showing their statistics up to the date of the corporate change within the year.

TABLE II.

AMOUNT OF RAILWAY CAPITAL

AT THE

CLOSE OF THE YEAR ENDING JUNE 30, 1900.

EXPLANATORY NOTE.

The statistics in this table are compiled on the basis of territorial grouping. With a few exceptions, which are explained by footnotes, the roads appearing in this table are those filing annual reports in season for use in all tabulations. The "Supplement," pages 330 to 333, inclusive, contains totalized figures for certain roads lying in more than one group. The group data for such roads were assigned to groups on the basis of the group location of "Line owned," except as otherwise indicated by footnotes.

TABLE III.

EARNINGS AND INCOME

FOR

THE YEAR ENDING JUNE 30, 1900.

A.—EARNINGS FROM OPERATION.

EXPLANATORY NOTE.

The statistics in this table were compiled on the basis of territorial grouping. The roads appearing in this table are, with a few exceptions, which are explained by footnotes, those filing operating reports in season for use in all tabulations. The "Supplement," pages 386 and 387, contains totalized figures for certain roads lying in more than one group. The group data in this table for some of these roads were assigned in this Office, as indicated by footnotes.

It should be stated in explanation of the use of "Miscellaneous," in the boxing of this table, that in column 6, under "Earnings arising from passenger service," it covers "Extra baggage and storage" and "Other items," and in column 11, under "Earnings arising from freight service," it covers amounts designated as "Other items."

TABLE III.

EARNINGS AND INCOME

FOR

THE YEAR ENDING JUNE 30, 1900.

B.—INCOME FROM PROPERTY OWNED BUT NOT OPERATED.

EXPLANATORY NOTE.

The statistics in this table were compiled on the basis of territorial grouping. With a few exceptions, which are explained by footnotes, the roads appearing in this table are those filing annual reports in season for use in all tabulations. The "Supplement," pages 426 and 427, contains totalized figures for certain roads lying in more than one group. For some of these roads the group assignment of income from "Stocks," "Bonds," and "Miscellaneous" was made in this office on the basis of the percentage proportion of "Income from other sources" of such roads for the different territorial groups in which they are located.

The rents received for lease of road, shown in column 20 of this table, do not include "Rents from tracks, yards, and terminals," which are included in "Other earnings," Table III-A, column 15.

TABLE IV.

GENERAL EXPENDITURES

FOR

THE YEAR ENDING JUNE 30, 1900.

A.—OPERATING EXPENSES.

EXPLANATORY NOTE.

The statistics in this table were compiled on the basis of territorial grouping. With a few exceptions, which are explained by footnotes, the roads appearing in this table are those filing operating reports in season for use in all tabulations. The "Supplement," page 457, contains totalized figures for certain roads lying in more than one territorial group. The group data in this table for some of these roads were assigned to groups in this Office, as indicated by footnotes.

It should be noted that in columns 5, 6, 7, and 8 the last three figures of the items, representing hundreds, have been omitted.

TABLE IV.

GENERAL EXPENDITURES

FOR

THE YEAR ENDING JUNE 30, 1900.

B.—FIXED CHARGES AND SUMMARY OF EXPENDITURES.

EXPLANATORY NOTE.

The statistics contained in this table were compiled on the basis of territorial grouping. The roads appearing in this table are, with a few exceptions, which are explained by footnotes, those filing annual reports in season for use in all tabulations. The "Supplement," pages 524 and 525, contains totalized figures for certain roads lying in more than one territorial group. For some of these roads data were assigned to territorial groups in this office. "Interest on funded debt," column 12, and "Interest on interest-bearing current liabilities," column 13, were assigned to groups on the same basis as railway capital in Table II. "Rents paid for lease of road," column 14, were assigned to the proper territorial group, so far as possible, as determined from a study of the existing conditions in each case. In the case of roads No. 1400, Groups VI and VIII, and No. 1472, Groups VI, VII, and X, however, there is an exception, the data for these roads being all assigned on the basis of the group location of "Line owned." The other items were so assigned on the basis of the percentage proportion of "Income from operation" for each road in the different territorial groups in which it is located.

It should be said in explanation of the items for certain roads that appear in bold-faced type that they represent the "Fixed charges" of subsidiary companies paid from the "Income from lease of road" received from the operating road. These items are separately totalized to avoid duplication, and should not be taken into account as showing a part of the "Fixed charges" of the railways of the United States considered as a system.

EXPLANATORY NOTE.

The statistics contained in this table were compiled on the basis of territorial grouping. The roads appearing in this table are, with a few exceptions, which are explained by footnotes, those filing annual reports in season for use in all tabulations. The "Supplement," page 565, contains totalized figures for certain roads lying in more than one group. The assignment of group data for such roads was made on the same basis as the assignment of railway capital in Table II, as explained on page 265.

The items in column 6 represent the interest on funded debt "accrued during year," and correspond with the items in Table IV-B, column 12.

TABLE VI.

GENERAL BALANCE SHEET

FOR

THE YEAR ENDING JUNE 30, 1900.

[Showing Increase or Decrease as compared with June 30, 1899.]

EXPLANATORY NOTE.

The statistics presented in the following table were not compiled on the basis of territorial grouping followed in the preceding tables. The roads appearing in this table are, with a few exceptions, which are explained by footnotes, those filing reports in season for use in all tabulations.

There is an occasional excess of funded debt in this table over similar data presented in Table II, because of the fact that duplications sometimes arise in the case of subsidiary roads, whose "Funded debt" has been assumed by the operating company. The general balance sheets of such subsidiary roads have been included in this table for completeness. In other cases both "Capital stock" and "Funded debt" in this table exceed the amounts shown in Table II on account of the apportionment of a part of such items "To other properties." These exceptions are explained by footnotes.

INDEXES.

EXPLANATORY NOTE.

It will be observed in the "Index to Railways" that following the names of railways are Roman and Arabic numerals, which refer respectively to the numbers of groups and of railways as used in Table I and all succeeding tables in this report, thus furnishing a convenient means of locating any railway on the page referred to. In "Supplement B" of Table I, pages 252 to 261, inclusive, the numbers used apply only to the roads there given, and are the numbers of the same roads appearing in the report for the year ending June 30, 1899. Some of these roads appear in Table II and following tables, with the same number printed in bold-faced type, for the purpose of presenting their statistics up to the date of a corporate change within the present year.
